Rainwater collection system

The **Gamart rainwater collection system** is a complete water catching and collection system adapted to various diameters and gutter systems. We produce catchers with diameters ranging from 50 to 110 mm, as well as catchers with leaf separators 100-110, gutter system leaf separators in the range 50-110, and home water tanks.

The catcher is designed to capture rainwater from the gutter downpipe. It is very simple, fully automatic design protects against overflowing the water in the tank even during heavy rainfall. When the tank is filled, excess water is discharged through a downpipe to a well or spout.

It is easy to install both to an existing downpipe and when installing a new gutter system. The connection to the tank can be made with any hose or pipe with an external diameter of 50 mm.

It is characterized by the highest water collection efficiency compared to other solutions on the market, especially in case of low rainfall, and does not require disassembly for the winter.

To protect against leaves and to avoid periodic cleaning of the catcher, a catcher with a leaf separator should be installed. In the upper part of the catcher there is a leaf separator with a removable basket for catching leaves and other debris from the roof. If it is not possible to use a catcher with a leaf separator/, it is recommended to install a gutter basket in the drain funnel.

The use of a catcher allows you to catch up to 100% of rainwater from the roof (it depends on the size of the tank), and thus reduces expenses for water supply and the possibility of exemption from paying the planned rainwater tax.

The system for filling the tank with rainwater has patent no. P418248.

Give your home an original look with a rainwater tank.

A rainwater tank with a capacity of 400 or 360 liters is an excellent solution for collecting rainwater. It has a cover that can be easily removed (e.g. to rinse or wash the tank inside). By turning the cover, you can place, for example, a pot of flowers on it.

The tank is designed to collect rainwater, which you can use at home and in the garden. You will use rainwater to water your garden and at the same time help take care of the natural environment.

At the front of the tank there are two threaded holes with a diameter of 3/4 inch (closed with plastic plugs), from which it is possible to draw the collected water using a tap or garden hose.

Tank material: **PE plastic**
Weight: **approx. 12-14 kg**

The rainwater tank fits perfectly with the GAMART rainwater catcher. The rainwater catcher is not included in the rainwater collection tank set.

The use of rainwater is becoming more and more popular nowadays. The rainwater management system allows for:

- **saving up to 50% of the water used from the water supply system,**
- **exemption from "rainwater tax",**
- **reducing water bills,**
- **having a reserve of rainwater and using it in times of deficit.**

Use the gutter holder to decorate or illuminate the building.

A gutter holder with holes of various diameters makes it easy to install all kinds of decorations or cabling. Thanks to it, you can easily distribute cables (LED strips, Christmas tree lights) along the gutter or attach hanging flowerpots.

The gutter holder is made of high-quality PVC, which makes it resistant to changing weather conditions.
